Hepatitis B Vaccination:

What You Need to Know

Hepatitis B vaccination is cancer prevention!

Hepatitis B is a vaccinepreventable liver infection caused by the Hepatitis B virus (HBV). Without treatment

1 in 4

people with Hep B develop serious liver problems

A common mode of HBV transmission is from mother to baby.

Without HBV vaccination at birth, newborns are **90%** more likely to develop a chronic HBV infection throughout their lives

Hep B is the leading cause of liver cancer in Asians Americans and Pacific Islanders.

When to Vaccinate

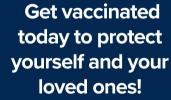

3 Doses

For adults ages 18-59 that did not receive the vaccine as a baby...

2, 3, or 4 Doses

The CDC suggests that all adults aged 18 and above should get tested for HBV. This includes people who have never been screened for HBV and those who don't have a long-term HBV diagnosis.

Talk to your doctor about screening and vaccination for Hepatitis B virus (HBV).
