Heart & Vascular Center

Current FDA approved and upcoming expanding indications for LAAO. What does the data show us?

M. Bilal Munir, MD Associate Professor of Medicine UC Davis

Learning Objectives:

- Current selection criteria for left atrial appendage occlusion (LAAO) device implantation
- Future indications
 - Patients with absolute contraindications to the anti-coagulants
 - DOAC eligible patients
 - Concomitant LAAO and other procedures
 - LAAO in specific group of patients

Current Selection Criteria:

Current indications for percutaneous LAAO in the United States

- LAAO is indicated to reduce the risk of thromboembolism from the LAA in patients with NVAF who
- 1 Are at increased risk for stroke and systemic embolization based on $CHADS_2$ or $CHADS_2$ -VASc score ≥ 2 .
- 2 Are deemed suitable for at least short-term antithrombotic therapy post-LAAO.
- 3 Have an appropriate rationale to seek a nonpharmacologic alternative to OAC.
- 5 No other indication for OAC than AF (e.g., prior VTE, mechanical valve, presence or predisposition to left atrial or left ventricular thrombus).
- 6 Anatomy appropriate for LAAO.

ACC/AHA/HRS 2023 Guidelines:

Recommendations for Percutaneous Approaches to Occlude the LAA Referenced studies that support the recommendations are summarized in the Online Data Supplement.

COR	LOE	Recommendations	
2a	B-NR	 In patients with AF, a moderate to high risk of stroke (CHA₂DS₂-VASc score ≥2), and a contraindication (Table 14) to long-term oral anticoagulation due to nonreversible cause, percutaneous LAAO (pLAAO) reasonable.¹⁻⁴ 	
2b	B-R	2. In patients with AF and a moderate to high risk of stroke and a high risk of major bleeding on oral anti- coagulation, pLAAO may be a reasonable alternative to oral anticoagulation based on patient preference, with careful consideration of procedural risk and with the understanding that the evidence for oral antico- agulation is more extensive. ^{1-3,5,6}

Expanding Indications:

 Patients with absolute contraindications to anti-coagulants: Where the current data stands?

Expanding Indications:

ASAP TOO trial

The <u>Assessment of the Watchman Device in</u> <u>Patients Unsuitable for Oral Anticoagulation</u> (ASAP-TOO) trial

David R. Holmes, MD,^a Vivek Y. Reddy, MD,^b Maurice Buchbinder, MD,^c Kenneth Stein, MD,^d Myriah Elletson^d Martin W. Bergmann, MD,^e Boris Schmidt, MD,^f and Jacqueline Saw, MD, FRCPC^g Rochester, Minneapolis, MN; New York, NY; Stanford, CA; Hamburg, Frankfurt, Germany; and British Columbia, Canada

Background Oral anticoagulants (OACs) reduce stroke risks with nonvalvular atrial fibrillation (AF); however, they are underused because of absolute or relative contraindications due to real or perceived risk of bleeding. Although left atrial appendage closure is increasingly performed in OAC-ineligible patients, this has not been studied in a randomized controlled trial.

Study objectives The ASAP-TOO study is designed to establish the safety and effectiveness of the Watchman left atrial appendage closure device in patients with nonvalvular AF who are deemed ineligible for OAC. The primary effectiveness end point is the time to first occurrence of ischemic stroke or systemic embolism. The primary safety end point includes all-cause death, ischemic stroke, systemic embolism, or device- or procedural-related event requiring open cardiac surgery or major endovascular intervention.

Study design This is a multinational, multicenter prospective randomized trial. Patients meeting the inclusion criteria with CHA_2DS_2 -VASc score ≥ 2 and who are deemed by 2 study physicians to be unsuitable for OAC will be randomized in a 2:1 allocation ratio to Watchman versus control. Control patients will be prescribed single antiplatelet therapy or no therapy at the discretion of the study physician. Up to 888 randomized subjects will be enrolled from up to 100 global investigational sites. Both device group and control patients will have follow-up visits at 3, 6, and 12 months and then every 6 months through 60 months.

Summary This trial will assess the safety and efficacy of Watchman in this challenging population of high-stroke risk AF patients. (Am Heart J 2017;189:68-74.)

2024 Northern California Structural Heart Summit

CrossMark

ASAP TOO:

- Not recruiting at this time, about 481 patients enrolled as opposed to planned 888
- Results of the recruited patients are not published as of yet

STROKE CLOSE trial:

ACTIVE, NOT RECRUITING 🕕

Prevention of Stroke by Left Atrial Appendage Closure in Atrial Fibrillation Patients After Intracerebral Hemorrhage

ClinicalTrials.gov ID

NCT02830152

Sponsor 🛈 Karolinska Institutet

Information provided by
Per Wester, Karolinska Institutet (Responsible Party)

Last Update Posted 1 2024-06-12

- Two arms, one arm LAAO with an amulet device with no initiation of oral anticoagulants and other arm on medical therapy
- All patients enrolled must have a history of intracranial hemorrhage
- This study is also not recruiting currently

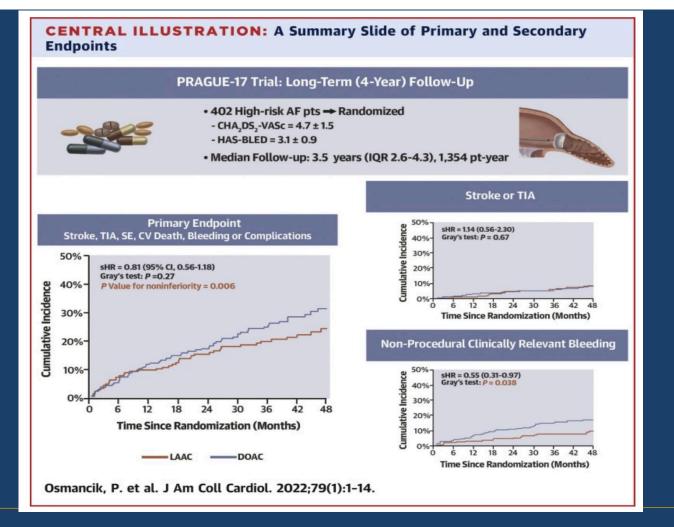

LAAO and DOACs:

- PRAGUE-17 trial
- Randomized trial comparing LAAO with DOACs in patients with clinically relevant bleeding and prior cardioembolic events or at risk of stroke
- Primary end-point was a composite of safety and efficacy events (cardioembolic events, cardiovascular death, clinically relevant bleeding or procedure/device related complications)

J Am Coll Cardiol. 2020;75:3122

PRAGUE-17 trial:

Risk of procedure-related complication was 5%

LAAO and DOACs:

CHAMPION-AF Clinical Trial (CHAMPION-AF)

ClinicalTrials.gov ID

NCT04394546

who are recommended for long-term NOAC therapy.

LAAO and DOACs:

- Both of these trials will compare safety and efficacy of LAAO with DOACs in patients with no apparent contraindications to the DOACs (patients are enrolled based on stroke risk and not by long-term DOAC ineligibility)
- These trials have distinct safety and efficacy end-points (unlike the PRAGUE-17 trial)
- Additionally, the safety outcomes will be adjudicated with a superiority design framework and not by non-inferiority
- The results of these trials and earlier trials (ASAP TOO and STROKE CLOSE) will inform the applicability of LAAO devices to a wider population with atrial fibrillation

LAAO and AF ablation:

In this retrospective study from NRD data, we identified patients undergoing combined LAAO and CA procedures on the same day in the USA from 2016 to 2019. A 1:1 propensity score match was performed to identify patients undergoing LAAO-only and CA-only procedures. The number of LAAO + CA procedures increased from 28 (2016) to 119 (2019). LAAO + CA patients (n = 375, mean age 74 \pm 9.2 years, 53.4% were males) had non-significant higher MACE (8.1%) when compared with LAAO-only (n = 407, 5.3%) or CA-only patients (n= 406, 7.4%), which was primarily driven by higher rate of pericardial effusion (4.3%). All-cause 30-day readmission rates among LAAO + CA patients (10.7%) were similar when compared with LAAO-only (12.7%) or CA-only (17.5%) patients. The most frequent primary reason for readmissions among LAAO + CA and LAAO-only cohorts was heart failure (24.6 and 31.5%, respectively), while among the CA-only cohort, it was paroxysmal atrial fibrillation (25.7%).

Conclusion

We report an 63% annual growth (from 28 procedures) in combined LAAO and CA procedures in the USA. There were no significant difference in MACE and all-cause 30-day readmission rates among LAAO + CA patients compared with matched LAAO-only or CA-only patients.

Option trial:

OPTION is a multinational, multicenter, prospective <u>randomized clinical trial</u>. Patients with a CHA_2DS_2 -VASc of ≥ 2 in men or ≥ 3 in women and who underwent a AF catheter <u>ablation procedure</u> between 90 and 180 days prior to randomization (sequential) or are planning to have catheter ablation within 10 days of randomization (concomitant) will be randomized in a 1:1 allocation of WATCHMAN FLX vs control. Control patients will start or continue market-approved oral anticoagulation for the duration of the trial. A total of 1600 patients were randomized from 130 global investigational sites. Follow-up for both device and control patients will occur at 3, 12, 24, and 36 months.

The primary effectiveness noninferiority endpoint is stroke (ischemic or hemorrhagic), all-cause death, or systemic embolism at 36 months. The primary safety superiority endpoint is nonprocedural bleeding through 36 months (International Society on Thrombosis and <u>Haemostasis</u> [ISTH] major bleeding or clinically relevant nonmajor bleeding). The secondary noninferiority endpoint is ISTH major bleeding through 36 months (including procedural bleeding).

LAAO and TAVR (WATCH TAVR trial):

LAAO and TAVR:

Primary End Point and Additional Clinical Outcomes

The composite primary end point (all-cause mortality, stroke or major/lifethreatening bleeding event within 2 years after randomization) was observed in 60 (33.9%) of patients randomized to TAVR + LAAO compared with 64 (37.2%) patients randomized to TAVR + medical therapy (Figure 2). For the ITT analysis of composite primary end point, TAVR + LAAO was noninferior to TAVR + medical therapy (22.67 versus 27.33 events per 100 patient-years with TAVR alone; HR, 0.86 [95% CI, 0.60– 1.22]; $P_{noninferiority}$ <0.001). However, TAVR + LAAO strategy was not superior to TAVR + medical management (P=0.40). The event rates were comparable for the primary
