

Close waste container lids after discarding waste

To prevent spillage and retrieval of contents, keep waste bin lids fully closed except when actively adding waste to the bin.

Many waste bins have foot pedals that open the lid hands-free to prevent contamination with infectious materials, and then automatically close the bin lid after use. Foot pedals may be present on many waste bin types, such as medical, hazardous, chemotherapy, RCRA, and pharmaceutical waste bins. Contact EH&S or EVS/Hospitality if a foot pedal mechanism is broken or malfunctioning.

Help us make sure that waste finds its place!
