

Pediatric Post-Operative Pain Management

Pain medication is given immediately following the surgery to help with post-operative pain. Upon discharge home, please give your child Acetaminophen (Tylenol) every 6 hours and Ibuprofen (Motrin) every 6 hours, alternating between medications every 3 hours (i.e. Take Tylenol and wait 3 hours, then take Motrin and wait 3 hours, repeat) for the first 3-4 days after surgery. If your child seems to be without significant pain, medications can then be given more infrequently. *It is important to follow dosing instructions on the medication bottle or prescription.*

If you need to call after clinic hours for a concern, call the UC Davis Medical Center hospital operator at 916-734-2011 and ask for the “physician on call for ENT.”
