Theoretical and computational cardiology. Mathematical modeling of action potential and calcium cycling. Nonlinear dynamics of cardiac phenomena including alternans, early and delayed afterdepolarizations, Ca sparks, Ca waves.

Synopsis:
Sudden cardiac death is the leading cause of death in the United States. Our knowledge of sudden cardiac death is still limited. CAST (Cardiac Arrhythmia Suppression Trial) and SWORD (Survival With Oral d-Sotalol) clinical trials failed and tested drugs increased mortality. These single target drugs often cause unpredicted phenomena in the heart, which is the highly complex system. The complexities come from nonlinearities in the heart. The goal of my research is to understand how molecular level properties are linked to organ level phenomena using mathematical analysis and multiscale modeling of the heart.

The goal of my research is to understand how molecular level properties are linked to organ level phenomena using mathematical analysis and multiscale modeling of the heart.

View list

Title
Assistant Professor, Pharmacology

Specialty
Pharmacology

Department
Pharmacology

Address/Phone
Genome and Biomedical Sciences Building, Genome & Biomedical Sciences Facility, 451 Health Sciences Drive Suite 3503 Davis, CA 95616
Phone: 530-752-3200

Additional Phone
Phone: 530-752-4440

Email
dsato@ucdavis.edu

Education
Ph.D., Northeastern University, Boston MA
B.S., Waseda University, Tokyo Japan
